248764	2
Number of cases	5

- 5 out of 5 clients have matrix data entered for the Safety domain and are included in the statistics.
- No clients have the value for the Safety domain coded as 'Other'(6).
 - No clients have null data for the Safety domain.

Note: This tab contains only data completeness information pertinent to the number of valid cases. It is not a comprehensive review of data quality.

Client-level data

18. Credit Domain

Client information

Client Id	Inital Score
147204	1
178177	2
212617	3
212619	3

Definitions

Term	Explanation
Population	The entire group of interest in a statistical analysis. For example, everyone who is served by a program. In statistical analysis, usually a sample, or subset, of the population is drawn to make inferences about the entire population. In ServicePoint, data are collected on everyone in the program. This is called a census, and it means that we can have population data (the population being everyone who is served) as opposed to sample data.
Distribution	For data that are observed, as we have here, a distribution shows the frequency of each value of the variable occurring in the data. The matrix domains, each of which can be thought of as a variable, have possible values of 1 through 5. Therefore the distribution of each domain is how many 1s there are, how many 2s, etc.
Measures of central tendency	Numbers that describe the middle, or expected value of a distribution. The measures of central tendency included in the report are the mean, the median, and the mode.
Measures of dispersion	Numbers that describe how the distribution is spread out, the variability of the distribution. For example, if the mean is 3, are all the values in the distribution 3? Or is the distribution comprised of 1s and 5s? Measures of dispersion included in the report are range, variance, and standard deviation.
N (Number of valid cases)	The number of cases included in a calculation. The number of cases may differ in different parts of an analysis, since some cases may have valid data for one type of calculation but not for another. For example, the number of cases included in summarizing the distribution only count scores of 1 through 5. The measure does not include the number of scores of "6 (Other)" or count missing data, since these data are not valid for what we are trying to do.
Minimum	The lowest recorded value in a distribution.
Maximum	The highest recorded value in a distribution.
Mean	Also referred to as the "average," or "arithmetic mean," the mean is the sum of the values of all the cases divided by the number of cases. While it is the most commonly used measure, it is also fairly heavily influenced by outliers, or uncommonly high or low values in the distribution. For example, if 4 cases had a value of 1 and one case was a 5, the average would be 1.8 even though the bulk of the distribution is clearly centered around 1.Therefore the mean should be compared with the other measures of central tendency in case the distribution is skewed by outliers.
Median	When all the values in the distribution are ordered in a list from lowest to highest, the median is the value in the middle of the list. If there is an even number of entries, the median is the average of the two values in the middle of the list.
Mode	The most frequently occurring value in a distribution.
Range	The distribution maximum minus the distribution minimum. A rough measure to show the extent to which the distribution is spread out.

Definitions

Term	Explanation
Variance	The average of the squared distances of the values in the distribution from the mean. We find the mean, then we subtract the mean from each value in the distribution. Some of these differences will be negative, since some values are less than the mean, so we square the differences to get rid of negative numbers. Then we add up these squared differences and divide by the number of cases to obtain the population standard deviation, or the number of cases-1 to obtain the sample standard deviation. The sample standard deviation gives a more conservative (larger) estimate than the population standard deviation, in order to compensate for instances of when all cases in the population are not included in the calculation. The variance gives us an idea of how spread out the distribution is over the mean. Big variances are indicative of wider distributions.
Standard deviation	The square root of the variance, which expresses the variance in the same scale as the mean. (Remember, the differences were squared in the variance to get rid of negative numbers. This corrects for the scale of the variance being increased by the squaring.) The square root of the sample variance is the sample standard deviation, and the square root of the population variance is the population standard deviation.

Additional Information

User Prompt Field	Value(s) Selected
First Assessment Date:	1/1/07
Last Assessment Date plus one day:	8/15/10
